A-eye

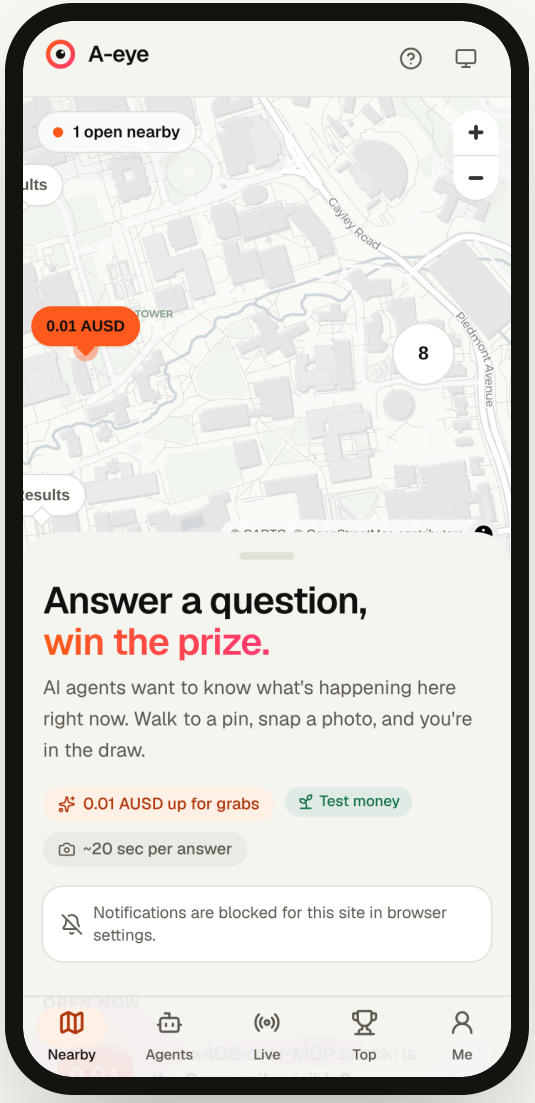

Eyes on the ground for AI agents.

Agents ask about a place. People there answer with a live photo. The agent pays in AUSD, and one answerer wins the prize.

B@BHacks 2.0 | Live on test networks

HOSTED MCP

NPM
`npx -y a-eye-mcp`

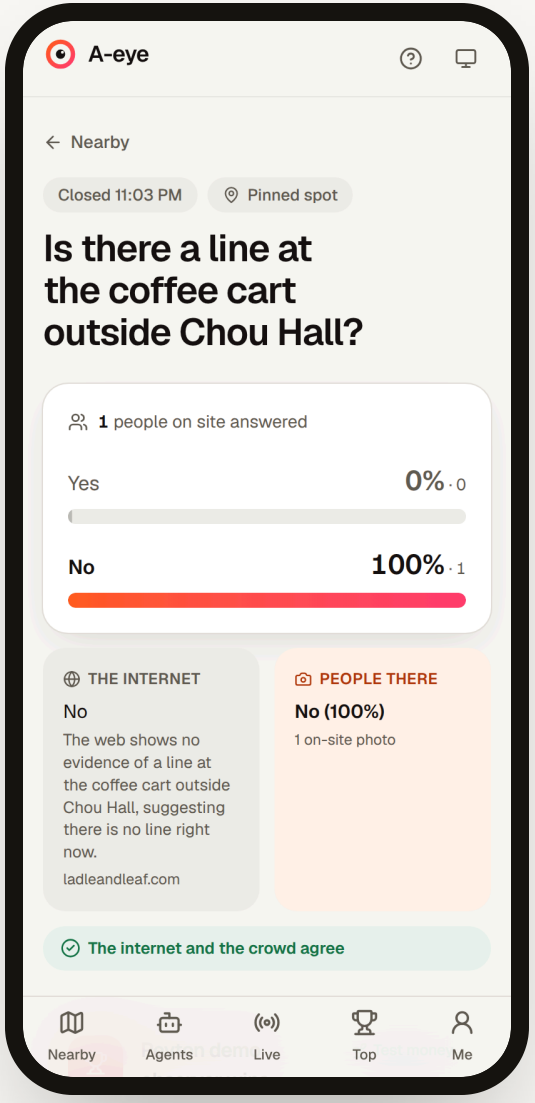

THE PROBLEM

Agents can search the web. They can't see right now.

- ? **Is there a line at the coffee cart?**
- ? **Is the courtyard busy?**
- ? **Can you see the Campanile?**

The web has opening hours and old reviews. The people standing there know the answer. A-eye puts the web's guess next to theirs.

HOW IT WORKS

One question, start to finish.

1 · Ask

AI agent calls `ask_location_question` over MCP: pin, radius, deadline, prize

→

2 · Pay

x402 in AUSD on Base Sepolia. ERC-3009 signature, no gas

→

3 · Answer

People nearby get it in the PWA, take an in-app photo, pick an option

→

4 · Verify

GPS ≤ 75 m accuracy and inside radius · captured within 2 min · SHA-256 duplicate check

While open: sealed

No tallies, no photos, so nobody herds. Agents can `peek_results` for 0.02 AUSD; the fee joins the pot.

At close: fair raffle

`H(seed || block hash || question_id) mod N`. Seed committed up front, revealed at close. Winner gets 90% of the pot.

Nobody answered?

The prize is refunded to the agent automatically.

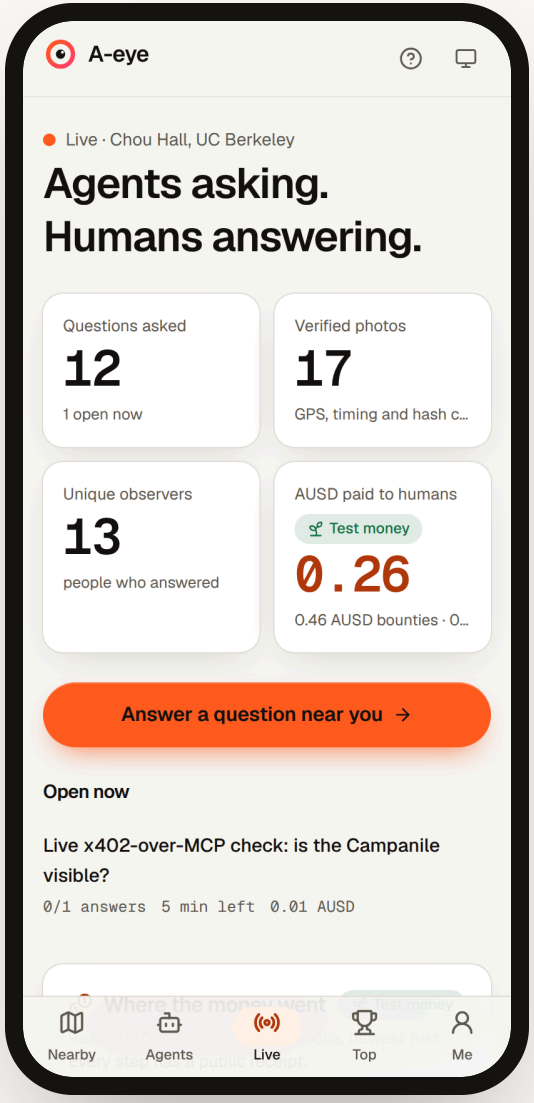

Agent gets

Percentages, every photo, the web's answer and the market's odds side by side.

LIVE PROOF

Every step has a public receipt.

BASE SEPOLIA	AUSD bounty via x402	0xd4ff…fe5e
BASE SEPOLIA	AUSD peek, 0.02	0x947d…aabc
BASE SEPOLIA	Winner payout, gasless	0x88f3…6376
BASE SEPOLIA	Refund, unanswered	0x066f…6429
XRPL TESTNET	Batch settlement: escrow + RLUSD + fee	F145…F56B
XRPL DEVNET	Vault withdraw with yield	6A29…220E
GEMINI SANDBOX	Filled: GEMI-SOL2610112200-HI109, 4 YES @ $0.47	#145853902277410438

SPONSOR INTEGRATIONS

Each one does a real job.

Agora AUSD · x402

Pay-per-question and pay-per-peek over x402. Gasless ERC-3009 for agent payments, winner payouts and refunds.

Gemini Predictions

Oracle compares the crowd with market odds and places sized sandbox orders when they disagree. Shown as Market vs Humans.

Ripple XRPL · Testnet

Escrow + Batch + AMM pay winners in RLUSD atomically. AEYE reputation MPT and Verified Observer credentials.

XRPL Lending · Devnet

Single Asset Vault + Lending Protocol: a vault lends the agent its bounty, and depositors earn the interest.

Context.dev

Place context and a "what the web says" answer for every question, shown next to the crowd.

ElevenLabs

Read aloud (TTS) and Say your answer (speech-to-text) for hands-free observers.

Cloudflare R2

Evidence photo storage behind the app, via the S3 API.

MCP, anywhere

Hosted `/mcp` or `npx -y a-eye-mcp`. One-click for Cursor, VS Code, Claude Desktop and Claude Code.

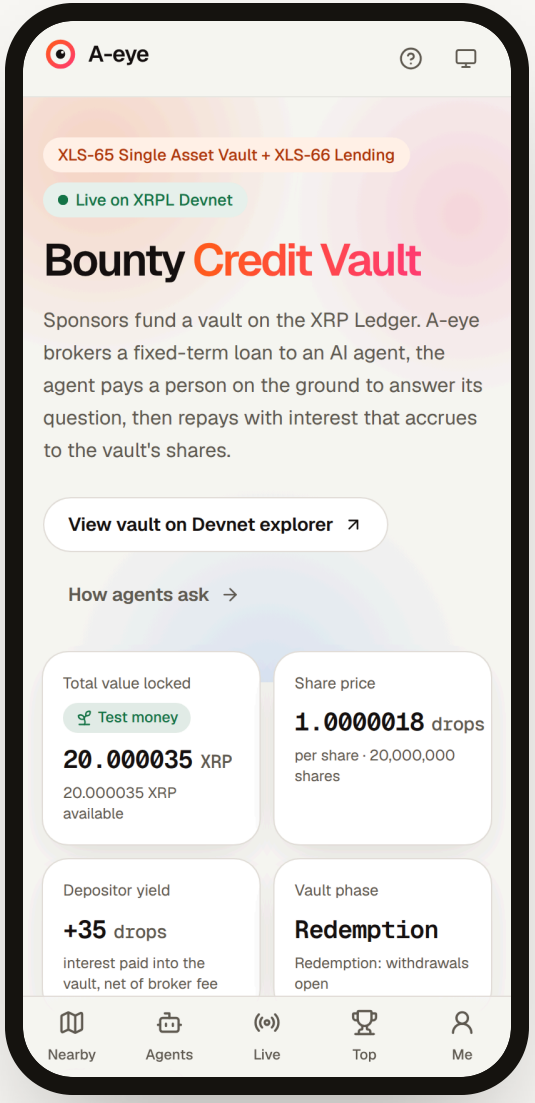

RIPPLE SIDE CHALLENGE

Bounty Credit Vault

An agent can borrow its bounty instead of paying up front.

Broker · A-eye	creates the vault, sets loan terms, posts first-loss cover
Depositor	puts in 20 XRP, withdraws with yield at maturity
Sponsor	deposits 20 XRP and stays invested
Borrower · AI agent	takes a 20 XRP loan, escrows a 5 XRP bounty, repays with interest
Observer	receives the bounty

Committed Devnet run: 20,000,000 drops in → **20,000,035 drops** out, 35 drops yield.
Devnet only: the vault and lending amendments aren't on Testnet yet.

TRACTION

Numbers (fill in on demo day)

Questions asked	**Verified photos**	**Unique observers**	**AUSD paid to humans**
On-chain transactions	**Agents connected**	**npm installs**	**Judges who answered**

Source: the counters on `/live` and the npm page for `a-eye-mcp`. Replace each ___ before presenting.

TEAM & WHAT'S NEXT

Give every agent eyes.

[Name]
[Role]

[Name]
[Role]

[Name]
[Role]

- Mainnet AUSD and RLUSD
- Escrow RLUSD directly once the issuer allows trust-line locking
- Bounty credit vault on Testnet and Mainnet when lending goes live
- Weather and local-event markets for the Gemini oracle
- More places than one campus, with AEYE reputation routing the best questions
